Abstract

MODULE, SYSTEM AND METHOD FOR TESTING A PHASE LOCKED LOOP

5 (with reference to FIG. 1)

A digital test module (5) is provided for testing a phase locked loop circuit. The module (5) includes phase detection circuitry (10) for performing phase measurements of the phase locked loop circuit and 10 analogue test circuitry (20) for testing at least one analogue element of the phase locked loop circuit. Frequency measurement circuitry (30) is provided for performing frequency measurements of the phase locked loop circuit, as is circuitry (40) for performing calibration and jitter measurements. In this way cycleto-cycle and phase jitter measurements may be made. A calibration mechanism is provided allowing a process evaluation to be made and which allows the jitter data to be provided in a few seconds. The fully digital design 20 facilitates easy manufacture and ready retargeting of the module to diverse applications and processes.
